

PHABRICATOR TOOL

Phabricator is a very effective open source tool that is widely used to improve software Quality , by many Tech Industries like Apple , Facebook , Google etc. Developer teams sends their codes to a reviewer who gets a email from phabricator asking him or her to review the code for any bugs or recommend any improvements if needed. Not only it does help in finding bugs and improvements , it is a great asset for developers to maintain a consistent style using code guidelines and best practices to make sure software development is adhering to Requirements specified. So in a nutshell i have summarized Phabricator into five Components as follows:

- Ø reviewing code before it hits master
- Ø auditing code after it hits master
- Ø hosting Git/Hg/SVN repositories
- Ø tracking bugs or "features"
- Ø Good Project Management
